

ABSTRACT

Group Name: Dream Makers

Group Members:

- Saranya S
- Rethanya S
- Rashika R

Platform: Object Detection

Programming language: OpenCV python

Aim:

To detect, locate, and track an object from an image or a video.

Description:

Object detection is a computer vision technology that involves identifying and localizing objects of interest within an image or a video.

Objectives:

- To scan digital images or real-life scenarios to locate instances of every object, separate them, and analyze their necessary features for real-time predictions.
- To recognize and locate all known objects in a scene.

Advantage:

- It has the potential to transform various industries by automating manual tasks and creating new, AI-powered products and services.
- It is an instant process that makes the workflow way easier and manageable.
- It allows us to be more efficient and to focus on some other task while the machine works on its own. Object Detection is a key task of Computer Vision
- Save time, improve search functionality, and enhance user experience

Result:

Thus, the project is initiated successfully.
